

Task 1: Getting Started with Power BI

Part 1: Installation and Initial Setup

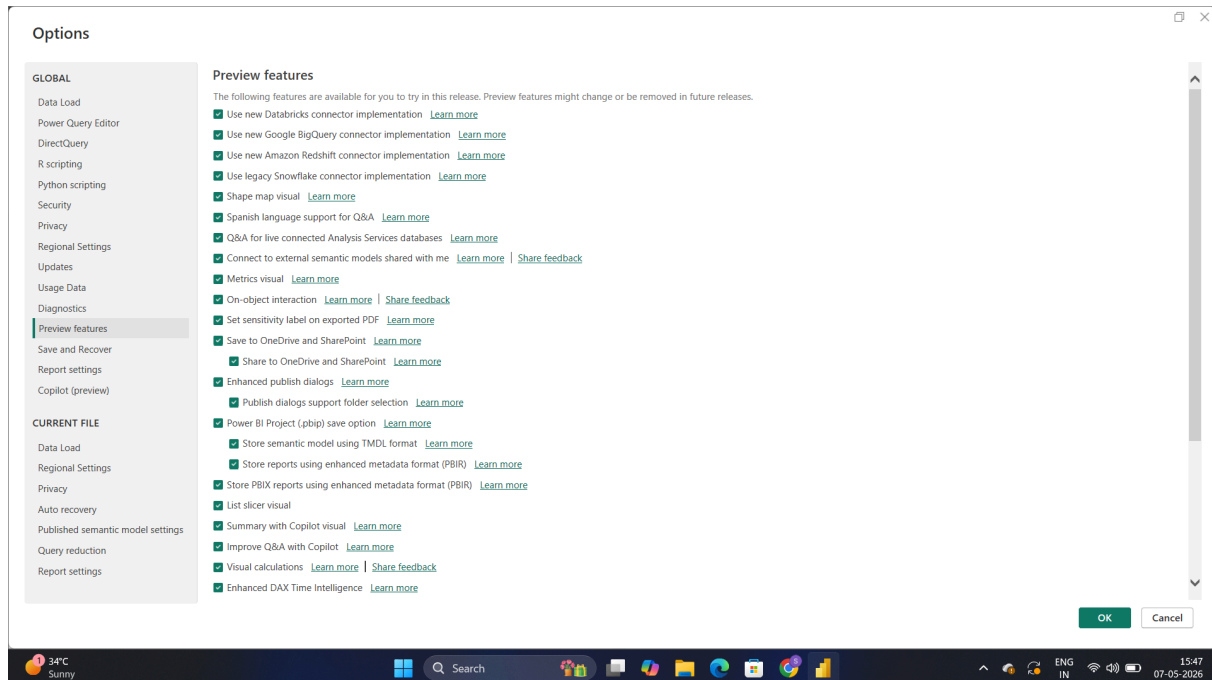

- Installation completed screen

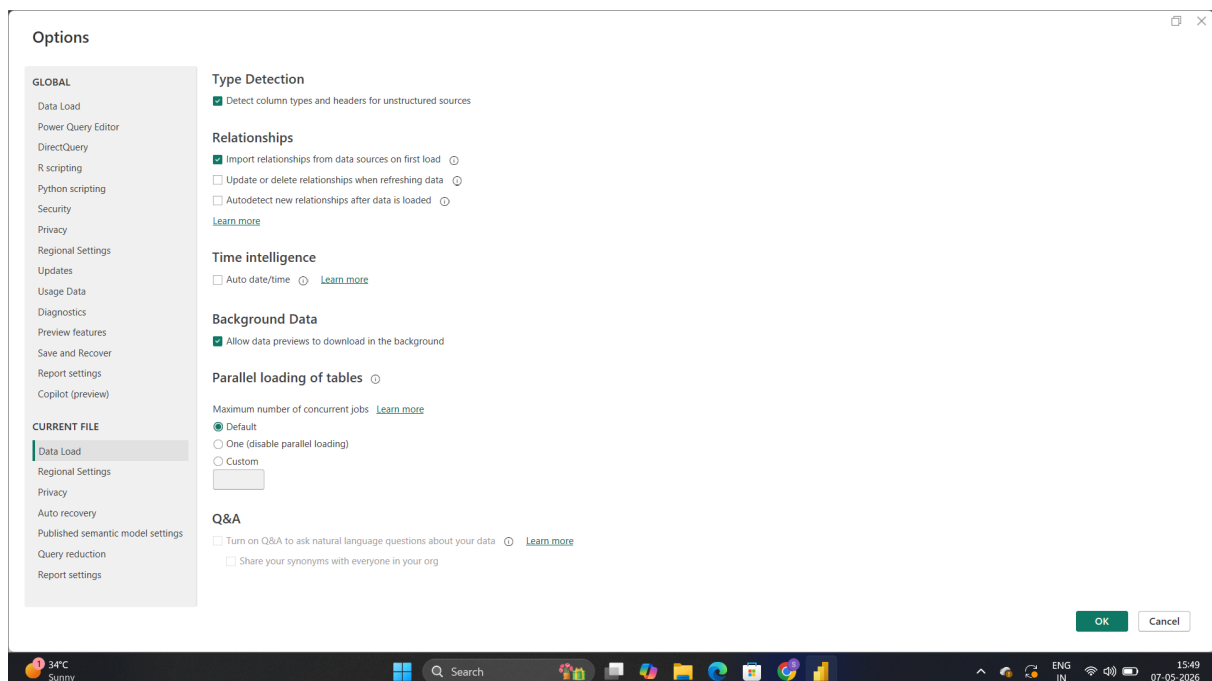

- Options window with changes highlighted

1. Preview Feature Enabled:

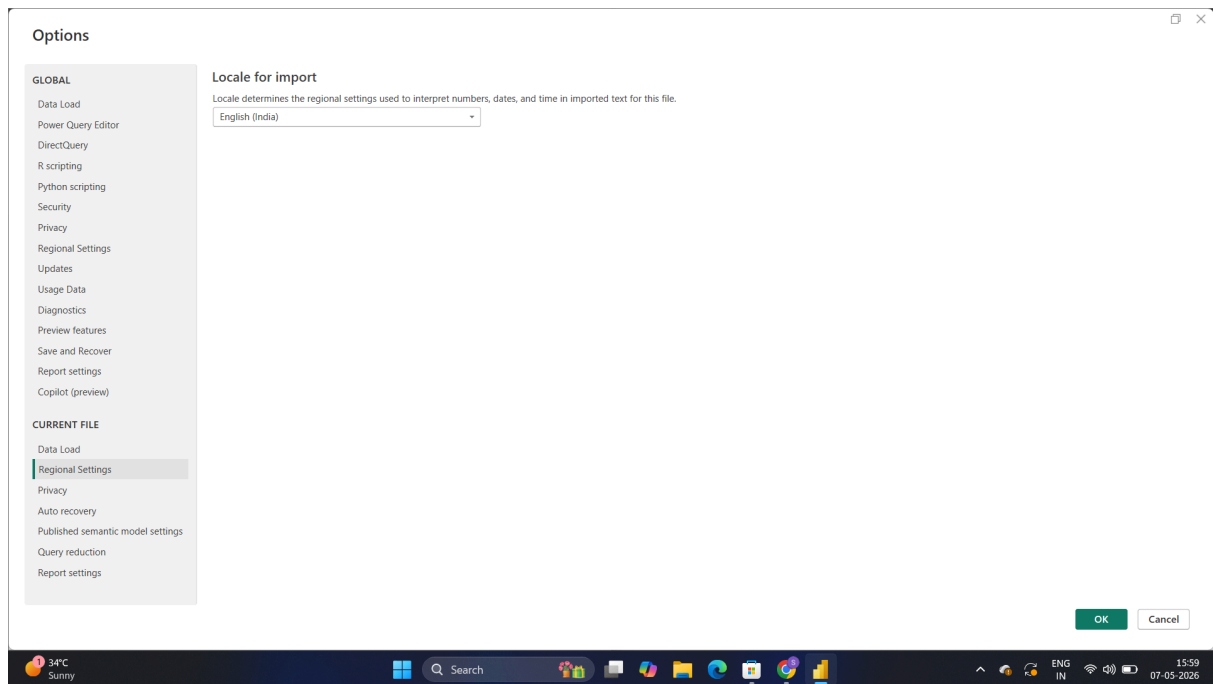

I have enabled all Preview Features

2. Data Load settings (unchecked)

3. Regional File Settings

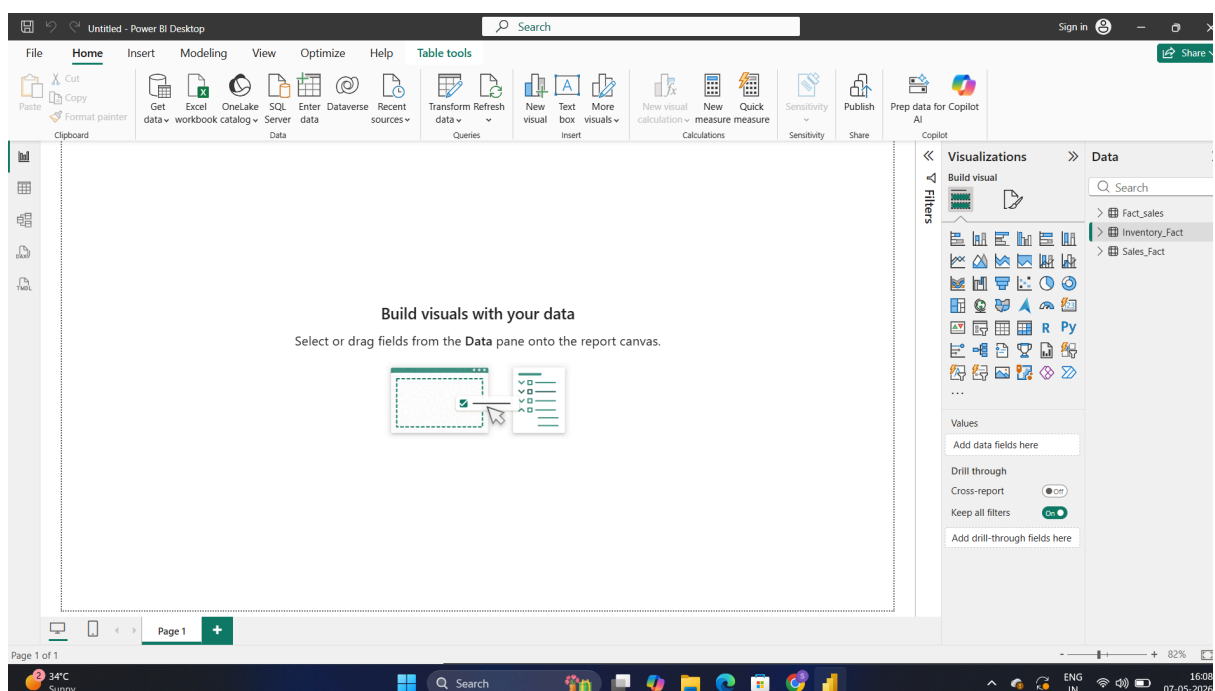

Question 1:

Why are preview features useful?

Preview features in Power BI are useful because they let users try new tools and updates before the official release. They help users explore advanced features, improve productivity, and stay updated with the latest technology. These features also allow Microsoft to collect feedback and improve the tools before final launch. However, preview features may still have bugs and are mainly meant for testing and learning.

Part 2: Exploring the Power BI Workflow

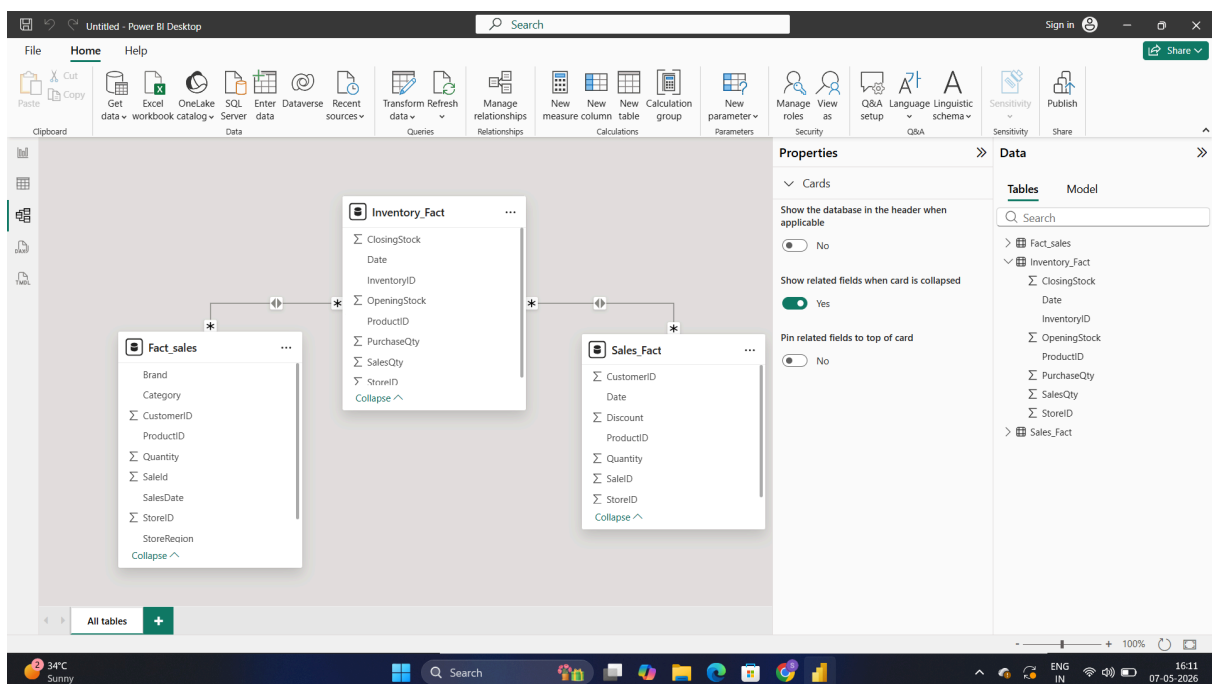

• Report View

- **Data View**

SaleID	SalesDate	ProductID	Category	Brand	StoreID	StoreRegion	CustomerID	Quantity	TotalAmount
10	02 January 2024	106	Apparel	Brand B	4	North	438	1	2827

561	29 May 2024	117	Apparel	Brand D	4	North	64	4	988
426	29 January 2024	84	Apparel	Brand D	4	North	751	1	4530

- **Model View**

Question 2:

Explain the basic purpose of each view and when you might use DAX in a project.

- **Report View:** Report View is use to create charts, plots, graphs and dashboards. It helps in visualizing the data for analysis.

- **Data View:** After loading the data, the data view helps to see and understand what type of data & features are there in the tables.
- **Model View:** If the data has different tables, model view is used to establish a relationship between the tables based on common features. It helps to understand how tables are connected.

Dax Query in Power BI is used to do the mathematical calculations such as totals, average, custom formulas on the features of the table for indepth analysis.
